Amulet Technologies Announces a New RoHS Compatible Version of Their Graphical User Interface (GUI) Chip

Amulet Technologies embraces RoHS regulations early as part of their ongoing effort to support customer development of RoHS compliant products by July 2006.

SAN JOSE, Calif. (June 21, 2005) – Amulet Technologies, inventor of the Graphical Operating System in Silicon, announced today that it has added a new RoHS (Restrictions on Hazardous Substances) compatible version of its popular GUI chip. The new chip will be available in July 2005, nearly a full year ahead of the mandated deadline. RoHS is a relatively new regulation issued by the European Union (EU) and Asia, for the purpose of eliminating certain environmentally hazardous materials used in the manufacture of electrical and electronic devices. As of July 2006, companies not in compliance with RoHS standards will not be able to sell their products in EU and Asian member countries.

Amulet Technologies began the process of becoming RoHS compliant early on for several pertinent reasons. According to Ken Klask, Amulet Technologies CEO, “Some of our customers are manufacturing consumer products for global markets where RoHS compliancy will soon be mandated. Offering lead-free packages today, will help to smooth the transition into RoHS compliancy for our current and future customers.” He adds, “The RoHS-compliant version of our existing chip is an additional pin-compatible product offered by Amulet—both versions will be available so customers can select the chip that best meets their design and manufacturing needs.”

Amulet is committed to making its complete product line RoHS compatible within the coming year. Under RoHS regulations the use of six harmful substances in electronics manufacturing including lead, mercury, cadmium, chromium Vi, polybrominated biphenyls and polybrominated diphenyl ethers are strictly prohibited. “We are committed to conducting our business in a manner that preserves our natural environment and are very proud to be an early supporter of the RoHS initiative,” stated Mr. Klask.

About Amulet Technologies

Amulet Technologies, LLC is a privately held, fabless semiconductor company that was founded to simplify the creation of graphical user interfaces (GUI's). Amulet reduces the amount of complicated programming required of LCD displays, while providing more visually appealing user interface's that provide the end-user with a positive overall Graphic User Experience (GUE). With Amulet's products and technology multi-disciplined teams can collaborate to visually create effective GUI's in substantially less time than traditional programming, using commercial HTML authoring tools such as Dreamweaver and Front Page.
